ACTIVITY: EXPLORING AND IMPROVING AI PROMPTS

My first prompt was “Make me a picture with a girl and a dog.” I wanted to create a simple and cute picture showing a girl with her dog. This was the starting point of my idea, which I later improved by adding more specific details to make the picture more personal and realistic.

My second prompt was to add more details to the picture because I wanted it to look like me and my dog. I asked for the girl to have a small mole on the left side of her nose and to smile showing her bunny teeth. I also wanted the dog to be a brown dachshund licking her cheek, with a collar that says “Yoogan.” I wanted these details because I wanted the picture to look more like us and show the bond between me and my dog.

ACTIVITY: EXPLORING AND IMPROVING AI PROMPTS

The difference between the two photos is that the first one was more simple, while the second one had more details and looked more personalized. At first, I only used the prompt “Make me a picture with a girl and a dog,” so the AI generated a general image based on my description. After that, I used an LLM (Large Language Model) to improve my prompt by adding more specific details about how I wanted the girl and the dog to look. I asked for the girl to have a small mole on the left side of her nose and a smile showing her bunny teeth, while the dog should be a brown dachshund licking her cheek with a collar that says “Yoogan.” By adding these details, I was able to guide the AI to create an image that was closer to what I imagined and more similar to me and my dog. This shows how an LLM can help enhance AI-generated images by improving the prompt and making the results more specific, realistic, and meaningful.
